

Abstract Session S05 Amateur-professional collaboration

Title: Latest results from the Bernard Lyot Telescope Associated Observers science programme

Authors: Anica Lekic et al.

The OATBLS present their latest results in this Gemini science poster session. The results come from the study of the spectra of high metallicity stars, obtained by discretionary time at the 2-metre diameter Bernard Lyot telescope at Pic du Midi. Measurements of surface gravity, metallicity and surface temperature were compared with the literature. This analysis work was carried out by OATBL members and students of the IPSA Vega association of IPSA.
